Unusual Manifestations of Sarcoidosis

Chronic meningitis occurs, with predilection for the base of the brain, and sometimes causes hydrocephalus. Less often, central nervous system parenchyma is involved. Papilledema may appear. Any or all of the cranial or peripheral nerves may be involved, especially facial, next often optic (neuritis or neuritisinitis may lead to optic atrophy). Extraocular paresis may occur. Pituitary and hypothalamus may be affected; the sella may be enlarged. Degeneration of the spinal cord tracts may follow nerve root lesions.
